## CH 302 Spring 2008 Worksheet 8 Answer Key

1.  $NaH_2PO4$  (conc. =  $C_{NaH2PO4}$ ) is dissolved in water. Write the mass balance equation for this system.

**Answer:**  $C_{NaH2PO4} = [H_3PO_4] + [H_2PO_4] + [HPO_4] + [PO_4]$ 

**2.** Write the charge balance equation for the solution in question 1.

**Answer:**  $[H^+] = [OH^-] + [H_2PO_4] + 2[HPO_4] + 3[PO_4]$ 

**3.** Write the charge balance equation for a solution containing all of the following ions: H<sup>+</sup>, OH<sup>-</sup>, Na<sup>+</sup>, Ba<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>, Ag<sup>3+</sup>, SO<sub>4</sub><sup>2-</sup>, and COOH<sup>-</sup>.

**Answer:**  $[H^+] + [Na^+] + 2[Ba^{2+}] + 3[Ag^{3+}] = [OH^-] + [COOH^-] + 2[SO_4^{2-}] + 3[PO_4^{3-}]$ 

**4.** NaH<sub>2</sub>PO<sub>4</sub>, LiHCO<sub>3</sub>, HCl, NaCl, and LiOH are all dissolved in water. How many equations are needed to completely describe this system?

**Answer:** In solution, we have: H<sup>+</sup>, OH<sup>-</sup>, Na<sup>+</sup>, H<sub>3</sub>PO<sub>4</sub>, H<sub>2</sub>PO<sub>4</sub><sup>-</sup>, HPO<sub>4</sub><sup>2-</sup>, PO<sub>4</sub><sup>3-</sup>, Li<sup>+</sup>, H<sub>2</sub>CO<sub>3</sub>, HCO<sub>3</sub><sup>-</sup>, CO<sub>3</sub><sup>2-</sup>, and Cl<sup>-</sup>. So we need 12 equations.

**5.** Write a charge balance equation for the system described in question 4.

**Answer:**  $[H^{+}] + [Na^{+}] + [Li^{+}] = [OH^{-}][Cl^{-}] + [H_{2}PO_{4}^{-}] + 2[HPO_{4}^{2-}] + 3[PO_{4}^{3-}] + [HCO_{3}^{-}] + 2[CO_{3}^{2-}]$ 

**6.** Write the mass balance equation for  $H_2CO_3$  (conc. =  $C_{H2CO_3}$ ) in water.

**Answer:**  $C_{H2CO3} = [H_2CO_3] + [HCO_3^-] + [CO_3^2]$ 

7. Find the pH of  $10^{-8}$  M HCl like you would have for the last two quizzes. Then find it using the exact expression,  $[H^+]^2 - [H^+]C_{HCl} - K_w = 0$ . Compare the two answers.

**Answer:** Like the last two quizzes:

$$[H^{+}] = C_a + 10^{-7} = 1.1 \times 10^{-7} \text{ pH} = 6.96$$

Exactly:

Solving the quadratic equation yields:  $[H^+] = 1.05 \times 10^{-7}$  pH = 6.98

The exact solution is a slightly higher pH because the extra  $H^+$  from the HCl causes a shift in the water equilibrium to the left, resuling in a lower  $[H^+]$ .

**8.** Repeat the same thing as in question 7, this time for  $10^{-2}$  M HCl.

**Answer**: Same work, so I'll just give the answers:

Like the last two quizzes: pH = 2

Exactly: pH = 2

So the water equilibrium really doesn't matter in this case.

**9.** Assuming an appropriate  $C_{HCl}$ , derive the approximate equation for a strong acid,  $[H^+] = C_a$ , from the expression given in question 6.

**Answer:** Assuming  $C_a$  is large, and since HCl is strong,  $[H^+]C_a >> K_w$ . So we get:

$$[H^+]^2 - [H^+]C_a - K_w \approx [H^+]^2 - [H^+]C_a = 0$$
 Divide by [H^+] 
$$[H^+] - C_a = 0$$
 
$$[H^+] = C_a$$

**10.** In class, you were showen that the exact [H<sup>+</sup>] for a weak acid is given by

$$[H^{+}]^{3} + K_{a}[H^{+}]^{2} - (K_{w} + K_{a}C_{a})[H^{+}] - K_{a}K_{w} = 0$$

Assuming appropriate values for  $K_a$  and  $C_a$ , derive the approximate equation for a weak acid,  $[H^+] = (K_a C_a)^{1/2}$ , from this expression.

**Answer:**  $K_w$  is small and we assume  $K_a$  is small "enough," so  $K_aK_w\approx 0$ .

$$[H^{+}]^{3} + K_{a}[H^{+}]^{2} - (K_{w} - K_{a}C_{a})[H^{+}] = 0$$
$$[H^{+}]^{2} + K_{a}([H^{+}] - C_{a}) - K_{w} = 0$$

Weak acids barely dissociate, so  $[H^+] \ll C_a$ . Furthermore,  $[H^+]^2$  and  $K_a[H^+]$  are both much larger than  $K_w$ . Thus, we get

$$[H^{+}]^{2} - K_{a}C_{a} = 0$$
  
 $[H^{+}] = (K_{a}C_{a})^{1/2}$ 

11. What is the pH of a 0.05 M  $H_2SO_4$  solution if  $K_{a2} = 1.1 \times 10^{-2}$ ? (In class, Dr. Laude did this using a RICE expression and ignored the water equilibrium. Feel free to use his same approach.)

**Answer:** Setting up the first RICE expression, assuming complete dissociation of the storng acid, at equilibrium you have  $0.05 \text{ M HSO}_4^-$  and  $0.05 \text{M H}^+$ . The second equilibrium produces the equation  $x^2 + 0.061 \times 10^{-2} \text{x} - 5.5 \times 10^{-4} = 0$  which yields the root x = 0.007974 which is the amount of  $H^+$  produced in the second dissociation. When added to the  $0.05 \text{ M H}^+$  from the first dissociation, the total  $H^+ = 0.0579 \text{ M}$  or a pH of 1.2.

**12.** Rank the concentrations of ions and neutrals at equilibrium in the solution formed in problem 11. Use some common sense reasoning to explain your answer without doing any calculations.

**Answer:** 
$$H_2O >> H^+ >> HSO_4^- >> SO_4^- > OH^- > H_2SO_4$$

 $H_2O$  is 55 M so it is largest. We assume  $H_2SO_4$  dissociates completely and is 0 M so it is the smallest concentration. In the RICE expression  $H^+$  and  $HSO_4^-$  are produced equally in the first dissociation, but some of the  $HSO_4^-$  dissociates to form  $SO_4^=$  and  $H^+$  so the total  $H^+$  is slightly higher than the  $HSO_4^-$ . The  $SO_4^-$  is the result of the second dissociation and so it is less than  $HSO_4^-$ . The  $OH^-$  will be very small because the solution is strongly acidic.

For Questions 13-20, list the species present in solution and write the system of equations that can be used to solve for their concentrations at equilibrium <u>exactly</u>. You don't have to actually solve the system (but if you're an engineer, go for it).

**13.** HF (conc. =  $C_{HF}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and F<sup>-</sup>. So we need 3 equations.

$$\begin{split} K_{w} &= [H^{+}][OH^{-}] \\ K_{a} &= [H^{+}][F^{-}]/[HF] \\ [H^{+}] &= [OH^{-}] + [F^{-}] \end{split}$$

**14.** HCl (conc. =  $C_{HCl}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and Cl<sup>-</sup>. So we need 3 equations.

$$K_w = [H^+][OH^-]$$

$$[H^+] = [OH^-] + [Cl^-]$$
$$C_{HCl} = [Cl^-]$$

**15.** HCl (conc. =  $C_{HCl}$ ) and NH<sub>4</sub>Cl (conc. =  $C_{NH4Cl}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, Cl<sup>-</sup>, NH<sub>3</sub>, and NH<sub>4</sub><sup>+</sup>. So we need 4 equations.

$$\begin{split} K_w &= [H^+][OH^-] \\ K_a &= [H^+][NH_3]/[NH_4^+] \\ [H^+] &+ [NH_4^+] = [OH^-] + [Cl^-] \\ [Cl^-] &= C_{HCl} + C_{NH4Cl} \\ C_{NH4Cl} &= [NH_4^+] + [NH_3] \end{split}$$

**16.** Ba(OH)<sub>2</sub> (conc. =  $C_{Ba(OH)2}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and Ba<sup>2+</sup>. So we need 4 equations.

$$K_w = [H^+][OH^-]$$
  
 $[Ba^{2+}] = C_{Ba(OH)2}$   
 $[H^+] + 2[Ba^{2+}] = [OH^-]$ 

**17.** HCOOH (conc. =  $C_{HCOOH}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and COOH<sup>-</sup>. So we need 3 equations.

$$\begin{split} K_w &= [H^+][OH^-] \\ K_a &= [H^+][COOH^-]/[HCOOH] \\ [H^+] &= [OH^-] + [COOH^-] \end{split}$$

**18.** NaOH (conc. =  $C_{NaOH}$ ) in water

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and Na<sup>+</sup>. So we need 3 equations.

$$K_{w} = [H^{+}][OH^{-}]$$
 $C_{NaOH} = [Na^{+}]$ 
 $[H^{+}] + [Na^{+}] = [OH^{-}]$ 

**19.** NaOH (conc. =  $C_{NaOH}$ ) added to a beaker containing Na<sup>+</sup> ions at a concentration of  $C_{Na}$ 

**Answer:** We have H<sup>+</sup>, OH<sup>-</sup>, and Na<sup>+</sup>. So we need 3 equations.

$$K_{w} = [H^{+}][OH^{-}]$$
 $C_{NaOH} + C_{Na} = [Na^{+}]$ 
 $[H^{+}] + [Na^{+}] = [OH^{-}]$
