Use the following table of standard reduction potentials:
http://www.jesuitnola.org/upload/clark.refs/red_pot.htm

1. Consider the redox reaction: \( \text{VO}^{2+}(aq) + \text{MnO}_4^- (aq) \rightarrow \text{MnO}_2(s) + \text{VO}_2^+(aq) \)
   a. Balance it in acid
      \[
      \text{H}_2\text{O}(l) + 3 \text{VO}^{2+}(aq) + \text{MnO}_4^- (aq) \rightarrow \text{MnO}_2(s) + 3 \text{VO}_2^+(aq) + 2 \text{H}^+(aq)
      \]
   b. Balance it in base
      \[
      2 \text{OH}^- (aq) + 3 \text{VO}^{2+}(aq) + \text{MnO}_4^- (aq) \rightarrow \text{MnO}_2(s) + 3 \text{VO}_2^+(aq) + \text{H}_2\text{O}(l)
      \]
   c. Calculate \( E^\circ_{\text{cell}} \)
      \[
      E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}} = 0.59 - 1.00 = -0.41
      \]

2. Consider the redox reaction: \( \text{BiO}^+(aq) + 2\text{Cr}^{3+}(aq) \rightarrow \text{Bi}(s) + \text{Cr}_2\text{O}_7^{2-}(aq) \)
   a. Balance it in acid
      \[
      5 \text{H}_2\text{O}(l) + 2 \text{BiO}^+(aq) + 2\text{Cr}^{3+}(aq) \rightarrow 2 \text{Bi}(s) + \text{Cr}_2\text{O}_7^{2-}(aq) + 10 \text{H}^+(aq)
      \]
   b. Balance it in base
      \[
      10 \text{OH}^- (aq) + 2 \text{BiO}^+(aq) + 2\text{Cr}^{3+}(aq) \rightarrow 2 \text{Bi}(s) + \text{Cr}_2\text{O}_7^{2-}(aq) + 5 \text{H}_2\text{O}(l)
      \]
   c. Calculate \( E^\circ_{\text{cell}} \)
      \[
      E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}} = 0.32 - 1.33 = -1.01
      \]

3. Consider the redox reaction: \( \text{Cd}(s) + \text{Co}^{3+}(aq) \rightarrow \text{Cd}^{2+}(aq) + \text{Co}^{2+}(aq) \)
   a. Balance it
      \[
      \text{Cd}(s) + 2 \text{Co}^{3+}(aq) \rightarrow \text{Cd}^{2+}(aq) + 2 \text{Co}^{2+}(aq)
      \]
   b. Calculate \( E^\circ_{\text{cell}} \)
      \[
      E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}} = 1.842 - (-0.403) = 2.245
      \]

4. Consider the redox reaction: \( \text{Fe}^{2+}(aq) \rightarrow \text{Fe}(s) + \text{Fe}^{3+}(aq) \)
   a. Balance it
      \[
      3 \text{Fe}^{2+}(aq) \rightarrow \text{Fe}(s) + 2 \text{Fe}^{3+}(aq)
      \]
   b. Calculate \( E^\circ_{\text{cell}} \)
      \[
      E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}} = -0.440 - (-0.771) = -1.211
      \]

5. What effect will raising the pH have on \( E^\circ_{\text{cell}} \) for
   a. the reaction in question 1 above?
      it will increase \( E^\circ_{\text{cell}} \)
   b. the reaction in question 2 above?
      it will increase \( E^\circ_{\text{cell}} \)

6. Consider the answer to 3b above. If \([\text{Co}^{3+}]\) and \([\text{Co}^{2+}]\) were both 1 M, what concentration of \([\text{Cd}^{2+}]\) could be used to make a 2.5 V battery based on this reaction?
   \[
   E_{\text{cell}} = E^\circ_{\text{cell}} - (0.05916/n_e)\log Q
   \]
   \[
   2.5 = 2.445 - (0.05916/2)\log([\text{Cd}^{2+}]·1/1)
   \]
   \[
   0.005 = -0.05916/2\log([\text{Cd}^{2+}])
   \]
   \[
   -0.169 = \log([\text{Cd}^{2+}])
   \]
   \[
   [\text{Cd}^{2+}] = 0.678 \text{ M}
   \]

7. Consider the answer to 4b above. Using the Nernst equation, what ratio of \([\text{Fe}^{3+}]\) and \([\text{Fe}^{2+}]\) would be present if this cell were allowed to reach equilibrium at room temperature?
   \[
   E_{\text{cell}} = E^\circ_{\text{cell}} - (0.05916/n_e)\log Q = 0 \text{ at equilibrium}
   \]
   \[
   0 = -1.211 - (0.05916/2)\log Q
   \]
   \[
   1.211 = - (0.05916/2)\log Q
   \]
40.94 = logQ
Q = [Fe^{3+}]/[Fe^{2+}] = 1.15 \times 10^{-41}

8. If \( E^{\circ}_{\text{cell}} \) for a particular reaction is negative,
   a. what are two things one could do to make the \( E^{\circ}_{\text{cell}} \) positive?
      You could lower the concentration of aqueous species or gases on the right side of the equation or raise the concentration of aqueous species or gases on the left side of the equation.
   b. what is one thing you could do to make \( E^{\circ}_{\text{cell}} \) positive?
      Reverse the cell.

9. Rank the following species from worst to best oxidizing agent: PbSO\(_4\), Na\(^+\), Fe\(^{3+}\), Cl\(_2\) and AgCl.
   \( \text{Na}^+ \quad \text{PbSO}_4 \quad \text{AgCl} \quad \text{Fe}^{3+} \quad \text{Cl}_2 \)

10. Rank the following species from best to worst reducing agent: Mn\(^{2+}\), Ni, H\(_2\), Al, Hg\(_2^{2+}\).
    \( \text{Al} \quad \text{Ni} \quad \text{H}_2 \quad \text{Hg}_2^{2+} \quad \text{Mn}^{2+} \)

11. What will be produced at the cathode
    a. for the reaction in question 1?
       MnO\(_2\)(s)
    b. for the reaction in question 2?
       Bi(s)
    c. for the reaction in question 3?
       Co\(^{2+}\)(aq)
    d. for the reaction in question 4?
       Fe(s)

12. What will be consumed at the anode
    a. for the reaction in question 1?
       VO\(^{2+}\)(aq)
    b. for the reaction in question 2?
       2Cr\(^{3+}\)(aq)
    c. for the reaction in question 3?
       Cd(s)
    d. for the reaction in question 4?
       Fe\(^{2+}\)(aq)

12. Calculate \( \Delta G \)
    a. for the reaction in question 1
       \( \Delta G = -nFE = -3\cdot96,485\cdot-0.41 = 118,677 \text{ J mol}^{-1} = 118.7 \text{ kJ mol}^{-1} \)
    b. for the reaction in question 2
       \( \Delta G = -nFE = -6\cdot96,485\cdot-1.01 = 584,699 \text{ J mol}^{-1} = 584.7 \text{ kJ mol}^{-1} \)
    c. for the reaction in question 3
       \( \Delta G = -nFE = -2\cdot96,485\cdot-2.455 = -473,741 \text{ J mol}^{-1} = -473.7 \text{ kJ mol}^{-1} \)
    d. for the reaction in question 4
       \( \Delta G = -nFE = -2\cdot96,485\cdot-1.211 = 233,687 \text{ J mol}^{-1} = 233.7 \text{ kJ mol}^{-1} \)

13. Calculate \( K \)
    a. for the reaction in question 1
       \( K = e^{(nFE/RT)} = e^{(3\cdot96,485\cdot-0.41/8.314\cdot298)} = 1.58 \times 10^{-21} \)
    b. for the reaction in question 2
       \( K = e^{(nFE/RT)} = e^{(6\cdot96,485\cdot-1.01/8.314\cdot298)} = 3.22 \times 10^{103} \)
    c. for the reaction in question 3
d. for the reaction in question 4

\[ K = e^{(nFE/RT)} = e^{(2 \cdot 96,485 \cdot 2.455/8.314 \cdot 298)} = 1.10 \times 10^{83} \]

14. If a current of 1 ampere can plate 3 moles of a certain product in 10 hours,
   a. how much of the same product could it plate in 20 minutes?
      (3 moles / 10 hours) x 1/3 hours = 0.1 moles
   b. what current would be needed to plate 6 moles in just 2 hours?
      1 ampere x (10 hours / 3 moles) x (6 moles / 2 hours) = 10 amperes

15. If a 5.5845 g sample of Fe is plated from an unknown solution in 482 minutes at a constant current of 1 ampere, what was the oxidation state of the Fe ion is solution?

   5.5845 g Fe x (1 mol / 55.845 g) = 0.1 moles Fe
   482 minutes x (60 seconds / minute) = 28,920
   \((I \cdot t)/(n_e \cdot F) = \text{moles} \)
   \((1 \cdot 28,920)/(n_e \cdot 96485) = 0.1 \)

   \(n_e = 3\), Therefore, the solution contained Fe\(^{3+}\).

16. Complete the table below from memory

<table>
<thead>
<tr>
<th></th>
<th>E</th>
<th>ΔG</th>
<th>K</th>
<th>Reduction</th>
<th>Oxidation</th>
<th>Cathode</th>
<th>Anode</th>

</tbody>
</table>

17. When electroplating metal (producing a solid metal from an ion by an electrolytic reaction), the amount of metal produced is
b. inversely proportional to
   current (I) and time (t)

18. Using the table mentioned at the top of this document, what species could
   a. reduce O\(_2\)(g) to H\(_2\)O(l) but not NO\(_3\)\(^-\)(aq) to NO(g)
      Br\(^-\)(aq)
   b. reduce Cu\(^{2+}\)(aq) to Cu\(^{+}\)(aq) but not Pb\(^{2+}\)(aq) to Pb(s)
      Sn\(^{2+}\)(aq) or H\(_2\)(g)
   c. oxidize Ag(s) to Ag\(^{+}\)(aq) but not H\(_2\)O\(_2\)\(\text{(aq)}\) to O\(_2\)(g)
      Fe\(^{3+}\)(aq)

19. Determine the number of electrons gained/lost by the carbon atom in each reaction below
   a. CH\(_4\) + 2 O\(_2\) + CO\(_2\) + 2 H\(_2\)O
      8 electrons lost
   b. CH\(_4\) + O\(_2\) + CH\(_2\)O + H\(_2\)O
      4 electrons lost
   c. 2 CH\(_4\) + O\(_2\) + 2 CH\(_3\)OH
      2 electrons lost

20. Consider the answer to question 19 above. How does a breaking a C-H bond and forming a C-O bond effect the oxidation state of C?
   It raises the oxidation number of the carbon by two.
